

enit **RECYCLE**®

eniter

The 2025 regulation mandates that 50% by weight of plastic waste be recycled (recovery rate), a figure that will increase in the coming years.

The integration of this mandate into industries should be gradual, anticipating the established deadlines and adopting recyclability as a key criterion in the product design phase. Following this approach, products manufactured at Eniter under the designation **enit RECYCLE**® are designed to facilitate the recycling process, according to the most suitable option from the following:

1 singlematerial

Packaging in which the layers of the laminate are made from the same recyclable material.

2 polyolefins

Polyolefin complexes (polyethylene and polypropylene), which can be recycled together.

3 monolayer

Recyclable monolayer packaging, ideal for subsequent recovery.

We carefully study each case to offer our clients alternative solutions that add value to a **circular economy**.
